                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               APPLICANT: Kolodner, Richard D.
APPLICANT: Reenan, Robert A.G.
APPLICANT: Fishel, Alchard
TITLE OF INVENTION: MISMATCH REPAIR GENES, GENE
TITLE OF INVENTION: PRODUCTS,
TITLE OF INVENTION: AND USES THEREFOR
NUMBER OF SEQUENCES: 44
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CORRESPONDENCE ADDRESS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

proteins KCNO2 and KCNO3. Detecting mutations in sequences that encode KCNO2 or KCNO3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BFNE). It transgenic animals) that express wild-type or mutant KCNO2 or 3 (also the proteins themselves in cell-free form) are used to screen for agents than be used to treat or prevent these forms of epilepsy. Fragments of the encoding nucleic acids are used as probes or primers, either for detecting mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type protein. Anthobides specific for mutant or wild-type proteins are used as a diagnostic reagents and for drug screening. The KCNO2 and 3 proteins are used are useful in rational design of drugs and therapeutically (in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      replacement therapies). The forms of epilepsy associated with mutations in KNO2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.

AAX57074-X57139 are primers used in the method of the invention.
                                                                                                                 This invention describes novel human and mouse potassium channel
Nucleic acid encoding potassium channels KCNQ2 and 3

```

This invention describes novel human and mouse potassium channel proteins KCNQ2 and KCNQ3. Detecting mutations in sequences that encode

```
KCNQ2 or KCNQ3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BFNE).

CC diagnosis and prognosis of benign familial neonatal epilepsy (BFNE).

CL transgenic animals) that express wild-type or mutant KCNQ2 or 3 (also the ranged to acrea forms of epilepsy. (RF) or 3 (also the correction themselves in cell-free form) are used to screen for agents that can be used to treat or prevent these forms of epilepsy. Fragments of the concoling mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type protein. Antibodies specific for mutant or wild-type proteins are used complete sequences and for mutant or wild-type proteins are used as diagnostic reagents and for mutant or wild-type proteins are used completed and forms of drugs and therapeutically (in replacement therapies). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.

CMANS7074-X57139 are primers used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence encoding complete mature and precursor forms of human tissue

                                        the sequence given here is claimed. Also claimed are antibodies which immunoreact with hurFH and the claimed peptides (given in AAP80713). The antibodies may be used in immunoassays for detection of hurFH. The claimed peptides may be used to inhibit the binding of hurF to coagulation factor VII/VIIa in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A DNA segment with a nucleotide sequence from about 130 to about 918 of the sequence given here is claimed. Also claimed are antibodies which immunoreact with hurFH and the claimed peptides (given in AAP80713). The antibodies may be used in immunoassays for detection of hurFH. The claimed peptides may be used to inhibit the binding of hurF to coagulation factor VII/VIIa in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           In synthetic analogs of turkey ovomucoid domain protein (6-56) (OWTKY3), given in AARG9818-24, the region immediately adjacent to the reactive site peptide bond is mutated to include the consensus sequence of furin or other serine protease. Polynucleotides encoding such analogs are incorporated into pEZZ318.thy2 and expressed in Escherichia coli RV308 (APCC 31608).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein inhibitors of serine proteinase(s), e.g. furin, deriv. from turkey ovomucoid third domain - used as laboratory reagents to study the proteinase(s), or as chemotherapeutic agents to treat diseases associated with them

Novel antisense oligonucleotides capable of inhibiting CAPL gene expression may include the trinucleotide duC (AR733326, given in 5' to 3' direction) found in codon 14 of CAPL mRNA. These and other antisense oligonucleotides (AA733327-36) complementary to specific regions of the CAPL gene (see also AA73335), as well as specific ribozynes (AA733337-40) can be administered to a patient as a means of inhibiting metastatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Engebraaten O, Fodstad O, Hovig E, Maelandsmo GJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  In synthetic analogs of turkey ovomucoid domain protein (6-56) (OMTKY3), given in AAR69818-24, the region immediately adjacent to the reactive site peptide bond is mutated to include the consensus sequence of furin or other serine protease. Polynucleotides encoding such analogs are incorporated into pEZZ318.thy2 and expressed in Escherichia coll RV308 (ArCC 31608).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein inhibitors of serine proteinase(s), e.g. furin, deriv. from turkey ovomucoid third domain - used as laboratory reagents to study the proteinase(s), or as chemotherapeutic agents to treat diseases associated with them
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

genes of the present invention.

SXS

```
The present invention relates to human and murine cDNAs from a neuroseansory defect associated gene family. The novel cDNAs are mouse tub form I (see AAA94632), mouse tub form II (see AAA94633), human TUB form 6 (see AAA94633), human TUDP (see AAA94633), human TUDP (see AAA94633), human TUDP (see AAA94633), human TUDP (see AAA94635), human TUDP) (see AAA94635), human TUDP) (see AAA94635), human TUDP) (see AAA94633), hu

Novel antisense oligonucleotides capable of inhibiting CAPL gene expression may include the trinucleot.ed GUC (AAT33326, given in 5' to 3' direction) found in codon 14 of CAPL mRNA. These and other antisense oligonucleotides (AAT3337-36) complementary to specific regions of the CAPL gene (see also AAT33345), as well as CAPL-specific ribozynes (AAT3337-40) can be administered to a patient as a means of inhibiting metasitatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; TULP; neurosensory defect; retina; retinal dystrophy; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAA9465
```

```
The present invention relates to human and murine cDNAs from a neurosensory defect associated gene family. The novel cDNAs are mouse tub form I (see AAA94630), human TUB form I (see AAA94631), human TULP1 (see AAA94632), human TULP2 (see AAA94632), human TULP2 (see AAA94632), human TULP2 (see AAA94638). The novel coding sequences are useful as immunogens to raise antibodies that specifically identify TUB/TULP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          expressing cells and in drug screening assays directed at neurosensory defects. The novel proteins encoded by the present sequence can be used for the treatment of neurosensory degenerative conditions e.g. retinal dystrophies. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Mammalian proteins expressed in retina and brain, useful for producing antibodies and for diagnosing neurosensory defects including cochlear degeneration, peripheral retinal degeneration and cone-rod retinal
                                                                                                                                                                                                                         Human; TULP; neurosensory defect; retina; retinal dystrophy; probe;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The polynucieotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to human breast cancer expressed polynucleotides AAALO5099) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to human breast cancer expressed polynucleotides (AAL07544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the arpression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosting, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New peptide useful as a marker for the diagnosis of breast cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Most esp. the sequences given in AAQ81664-67 represent core sequences of which at least one is present in each of the binding oligos. These oligonuclectides may form a single strand, double strand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. BFGF binds to high affinity receptor and low affinity heparin-like molecules on the affinity receptor and low affinity heparin-like molecules on the affinity receptor and heparin. These oligonuclectides may inhibit or enhance the activity of BFGF. Particularly, they inhibit neovascularisations of they can be used to suppress growth of soiled tumours and to reduce the risk of metastasis. They can be used as changed in the presence of thrombin, or used in

q à

```
The sequences given in AAQ81642-95 are oiigonucleotides which modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with its receptor and heparin. These oligonucleotides may inhibit or enhance the activity of bFGF. Particularly, they inhibit neovascularisation so they can be used to suppress growth of solid tumours and to reduce the risk of metastasis. They can be used as diagnostic reagents to determine the presence of thrombin, or used in
                                                                                                                                                                                                                                                                          the activity of basic fibroblast growth factor (bFGF) by binding to the bFGF protein. Most esp. the sequences given in AAQB1664-67 represent core sequences of which at least one is present in each of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                  the binding oligos. These oligonuclectides may form a single strand, double strand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. BFGF binds to high affinity receptor and low affinity heparin-like molecules on the cell surface. These oligonucleotides bind to bFGF in competition with its receptor and heparin. These oligonucleotides may inhibit
New oiigo-nucleotide(s) that bind to basic fibroblast growth factor - modulating, esp. inhibiting, its activity, useful in treating cancer, preventing metastasis, and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Basic; fibroblast growth factor; bFGF; stem-loop structure; bubble structure; pseudoknot; receptor; heparin; competition; inhibition; enhance; neovascularisation; soild tumour; cancer; metastasis; diagnosis; gene therapy; ss.

New oligo-nucleotide(s) that bind to basic fibroblast growth factor - modulating, esp. inhibiting, its activity, useful in treating cancer, preventing metastasis, and diagnosis.

Claim 3; Page 25; 44pp; English.

The sequences given in AAQB1642-95 are oligonucleotides which modulate the activity of basic fibroblast growth factor (bFGF) by binding to the bEGF protein. Most esp. the sequences given in AAQB1664-67 represent core sequences of which a least one is present in each of the binding oligos. These oligonucleotides may form a single strand, double strand, a stem-loop structure, a bubble structure, a pseudoknot or a closed, circular structure. BFGF binds to high a finity receptor and low affinity heparin-like molecules on the affinity receptor and heparin. These oligonucleotides bind to bFGF in competition with its receptor and heparin. These oligonucleotides may inhibit or enhance the activity of bFGF. Particularly, they inhibit concascularisation so they can be used to suppress growth of solid tumours and to reduce the risk of metastasis. They can be used as thrombin, or used in gene therapy.
